Phone: 813-745-8343

Email: Roger.Li@moffitt.org

Office: 813-745-8343

Project/Lab Description:

This research project offers a unique opportunity to learn about how bladder cancer is treated, integrating cutting edge surgical and medical treatment paradigms. Under the guidance of physicians and physicians-in-training, the student will gain access to patient medical records and learn to extract vital information critical to clinical decision making. Through this process, the student will develop a comprehensive understanding of not only the treatment algorithm for bladder cancer, but also the medical system as a whole.

Time Commitment: 5-10 hrs per week

Student Requirements: Students must meet all criteria to participate in Moffitt research

Learning Outcomes: List 3-5

1. What is non-muscle bladder cancer and how is it treated?
2. What is muscle invasive bladder cancer and how is it treated?
3. What is the prognosis for patients with non-muscle invasive and muscle invasive bladder cancers?
4. To learn how to navigate clinical charts and to extract all vital clinicopathologic variables, and survival outcomes.
5. To develop skills to enable critical clinical judgement in the context of bladder cancer diagnosis and treatment.
